Iowa State University
Department of Aerospace Engineering

Purpose: To create an assembly in SolidWorks.

1. The first step is to import the base plate, which is the lowermost part of the entire design.
2. Next, we upload the column file. This will give us a second piece of the design that fits perfectly into the base plate. To assemble them together, you need to select the lower part of both base plate and column, and use the mate function to put them together. We do this twice.
3. Next, we upload the push plate file and use the concentric function within mate to make sure the columns slide into the push plate holes.
4. Next, we upload the top plate file. Using the mate function once again, we put it on top of the parts that are already assembled in a lid type of way.
5. Once that is done, we need to upload the centerpiece file. Using the mate function, we need to make sure it goes in the middle hole in the design.
6. We then upload the handle function and use the mate function once again to make sure they fit together.
